

# 1

1: How can you quickly retrieve a sample of records from each table?

The way you can quickly retrieve a sample of records from each table is by SQL queries with Limit.

2: How can you modify the query to specify columns to retrieve from a table?

The way it looks to modify a query in MySQL Workbench to specify which columns to retrieve from a table, you simply need to list the desired columns in your SELECT statement instead of using the \* wildcard, which retrieves all columns.

3: How can you use the interface to change the limit of records displayed?

To change the limit of records displayed, you can adjust the "Limit Number of Rows" setting in the Preferences under the SQL Editor tab. Additionally, you can specify the ( Limit ) clause directly in your SQL queries.

# 2

1: What data does the table contain?

The data that the table contains is what a business needs to be either a successful business or at least an up and running business.

2: What does this tell you about the business behind the database?

This tells me that creating a business has a lot of sub categories.

3: What adjustments

might you make to your brainstorming document regarding records to track for your friend's business?
